Ornithopods

For mange millioner år siden gikk dinosaurer rundt på Svalbard. Fotsporene hadde avtrykk av klør. Derfor var vel dinosaurene kjøttetere? Eller var de ikke?
GAN Aschehoug

Et blekksprutfossil er sjeldent. Blekk i en fossil blekksprut er enda mer sjeldent. Kan blekket fortsatt brukes?

Hvem drepte ammonitten?
GAU Aschehoug

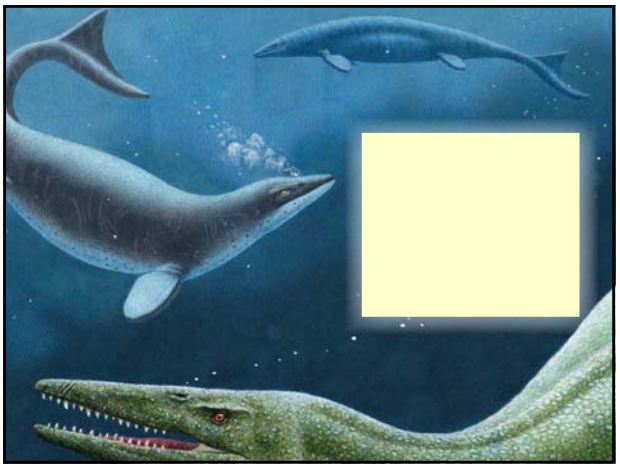

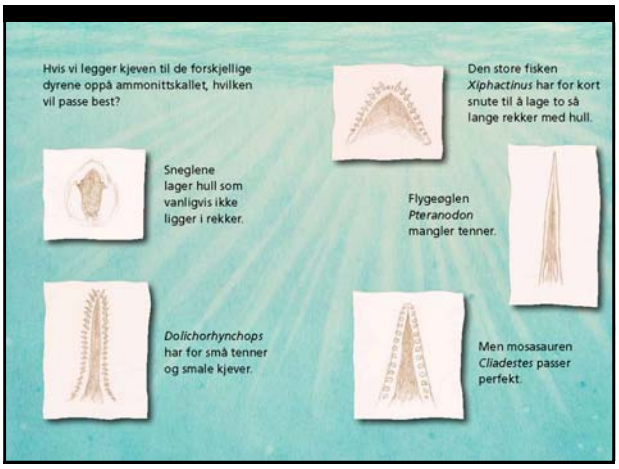

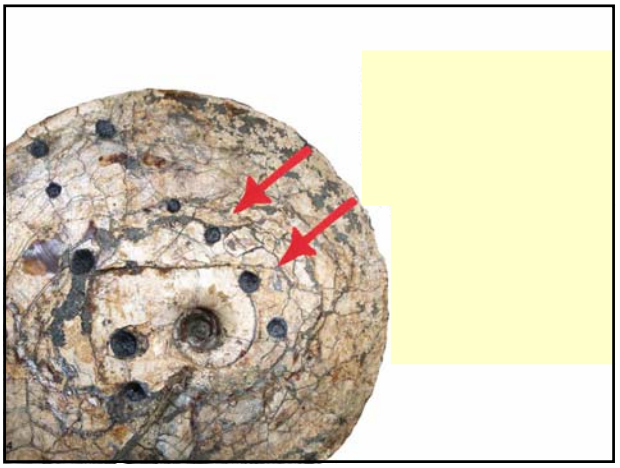

Hvis vi legger kjeven til de forskjellige dyrene oppå ammonittskallet, hvilken vil passe best?
Den store fisken *Xiphactinus* har for kort snute til å lage to så lange rekker med hull.
Sneglene lager hull som vanligvis ikke ligger i rekker.
Flygeøglen *Pteranodon* mangler tenner.
Dolichorhynchops har for små tenner og smale kjever.
Men mosasauren *Cliadestes* passer perfekt.

URHAVET

Tur 4

Yrende liv i havet

SLEMMESTAD

Sted: Slemmestad

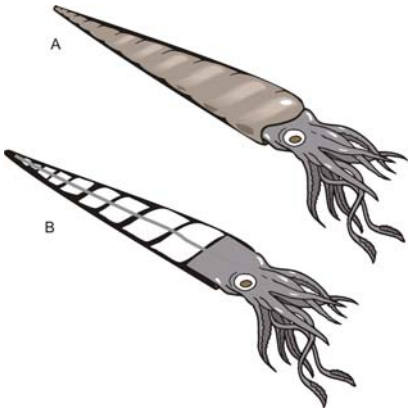

Avstand: 4 km

Parkering: ved bibliotekет eller på bensinstasjonen ved innkjørselen til Slemmestad.

Kartkoordinater:

Mål med turen: Å finne spor etter urhavet og de mest vanlige dyrene som levde der.

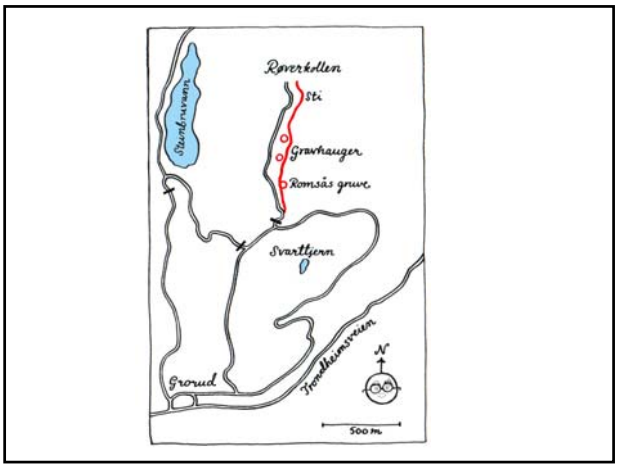

Supervulkaner

kokt stein gir metaller

Røverkollen
Sti
Gravhauger
Romsås gruve
Svarttjern
Grorud
Trondheimsveien
